·   Did dinosaurs really exist?
Dinosaurs certainly did roam the Earth in the ancient past! Fossils of dinosaurs have been found all over the world, and their bones are displayed in museums for all to see. Scientists have been able to reconstruct many of their skeletons, so we know much about how they may have looked.
·   When were dinosaurs found?
The story of their discovery began back in the 1820s when Gideon Mantell (an English doctor) found some unusual teeth and bones in a quarry. Dr. Mantell realized there was something very different about these animal remains, and believed that he had found an entirely new group of reptiles. By 1841, about nine types of these different reptiles had been uncovered. At that time, a famous British scientist (Dr. Richard Owen) coined the name "Dinosauria"– meaning "terrible lizard"–for this is what the huge bones made him think of.
·   How big were dinosaurs?

Some were as small as chickens and others were even smaller. Of course, some dinosaurs were very large–weighing in at an estimated 80 tons and standing 40 feet high! The average size of a dinosaur, however, was probably about that of a large sheep or bison.

· When did dinosaurs live?

The story we have all heard from movies, television, newspapers, magazines and textbooks is that dinosaurs lived millions of years ago. According to evolutionists, the dinosaurs "ruled the Earth' for 140 million years, dying out about 65 million years ago. Other scientists (called creation scientists) have a different idea about when dinosaurs lived.
